About the project

Problems

1. The slow growth of medical capacity, the insignificant effect of progress in medicine on human health, and quality of life.
2. Weak integration of science in the diagnosis of the human condition and treatment of diseases - both congenital and acquired.
3. Scientific advances in medicine are rarely implemented. They often remain “on paper”, blocked by patent restrictions and bureaucracy. If the restrictions and all legal issues are settled, a long-term period of integration of scientific knowledge and achievements into real life is required. They will be implemented in developed countries first, with limited access. Decades may pass before the technology is widely accepted.
4. Perception of the current situation as a given, without the possibility to change it. The current situation is considered “normal”.
5. Scientists are supported on a leftover basis. The most important role is frequently played by charities and individuals. The government stands aside from this issue, especially in developing countries. Developments are ignored and lost.

Solution

1. Launch of a marketing campaign focused on increasing of value of health, quality and opportunities of medicine
2. Creation of a non-profit organization. It will include research centers, R&D centers, clinics for the practical implementation of knowledge and technologies.
3. Formation of the main directions of development that require a revolution in the methods of diagnosis and treatment. Special attention should be paid to rare diseases that are currently considered as “commercially impractical” to research.
4. Creation of a development ecosystem that will bring together researchers, scientists, medicine, and IT specialists. Creation of a global cluster that will work on solving issues

Goals

Our main goal is to change a person's thinking and life planning

Goals for the next 5 years:

1. Increasing the human life expectancy by 10 years until 2027. Development in this direction, search for current constraints and their elimination.
2. Increasing the medical capacity and abilities of medical professionals in the diagnosis and treatment of diseases
3. Increasing the ability to diagnose health conditions for everyone
4. Creation of a research center and clinic within the framework of a solution to main problems.

Action plan:

1. Development of a mobile/stationary blood oxygen enrichment apparatus. A modern and quick solution, an alternative to mechanical ventilation and ECMO (the problem of maintaining a person's life with severe lung damage)
2. Development of modern equipment - both for professional and home usage. Expanding the possibilities of diagnosing the state of blood vessels and blood flows. Emphasis on this area as the main method for studying strokes and heart attacks.
3. Study of the detailed effect of viruses on the human body. Development of methods that will influence the course of the disease (as currently, medicine is impotent in the fight against viruses).
4. Development of methods for the diagnosis of cancerous tumors in the early stages. In-depth study of blood and other indicators of the body, which will make it possible to accurately determine and describe the processes. Possibility of treating diseases in the early stages.
5. Launch of a program for the development of treatment for children with severe illnesses under 10 y.o.
6. Fighting dementia and Alzheimer's. Development of methods of early diagnosis, designing a program of prevention and treatment of this disease.

Project values

Changing the paradigm of human life

Great-grandparents are usually the last living generation in many families. As the next generation is born, they're about 80-90 years young, which is more than the average life expectancy in most countries.

A person can lead an active, high-quality lifestyle up to 60-70 years of age. Our task is to increase this duration to 90-100 years.

People will be able to plan their "second youth" when they're 60, which gives them additional 20-25 years of life after retirement.

It is important to pay special attention to cognitive capabilities, as health should allow people to manage both work and hobbies.

Great-grandparents will take an active part in raising children. They will have an active lifestyle with no slowdown in body functions, no attention or memory loss. They will have a desire to live and understand life's purpose, thus easily solving age crises.

The quality of life

The quality of life is just as significant as its duration. The opportunities for children born with serious illnesses and dysfunctions are limited, and therefore they often lead a miserable life (no matter how long it may be).

There is no point in prolonging life if medicine and science are not able to improve their quality. This is a complex issue that can be solved by the joint efforts of doctors and scientists.

Life is priceless

Life can be evaluated in monetary terms, neither in fiat nor in a crypto asset. We can only assess the possibilities of improving human health through the interaction of science and medicine.

The knowledge and products are recorded in the GTM coin

This includes patents, surgeries, drugs, equipment. This is all tied to the value of the project's coin. When selling developments, a crypto asset can be converted into fiat or another crypto asset.

Following the whitepaper

Life and its quality are the highest value for everybody. The economic success of the project determines its effectiveness in product research and development.

Researchers, doctors, managers, lawyers, and governments are the driving force of the project.

Patenting “everything and everywhere”

Patenting is used to protect copyright and control the use of our methods. We do not limit the use of our technologies. We need to evaluate the performance and monitor the use of technology to move in the right direction.

International importance

The team plans to create a knowledge base with all the research open to the public and distributed through the Big Data hub after obtaining licenses and patents in all the countries.

Tokenomics

We issued a fixed number of coins according to the approximate number of human population.

Quantity : 8,000,000,000 coins.

Additional emission: No

Transaction fee - 0.1% towards the creator's wallet account

Burning - 0%

Liquidity - 0%

Token Lockup

<https://www.team.finance/view-coin/0x9dcD80748b6bDC6aF0B7d51253743f6Fdb226c34?name=Givetime&symbol=GTM>

Distribution model:

Marketing - 13%

Development - 2%

Implementation of offline project initiatives- 75%

Stabilization fund - 10%

There is a default fund distribution model. The initial funds will be used for marketing and expanding the project's team.

Note: *It is possible to switch to your own blockchain if such a need is identified and supported by the project's development team.*

Offline implementation

We expect to launch a research center and a clinic as a result of the successful development of this project. It will be a non-profit organization, meaning all the profits from the activity will be invested in research and development, equipment development and treatment methods.

The legal registration of the organization is planned at the 2nd stage of the roadmap.

GTM (Givetime) token will be the main tool for the project's value assessment, selling rights to use the patents and cure methods. All the above will support its liquidity.

Offline implementation will increase the demand for the coin as it will be the main way to use the goods and services provided by the project.

Benefits of holders

Development of the program is planned for the beginning of 2023. Such benefits can be:

- Top-100. Private community with the project's team
- Top-100. Priority clinical service
- Top-100. Priority in sales of diagnostics equipment
- Top-100. Priority in the use of technologies, methods and patents

- Top-1000. Priority clinical service
- Top-1000. Invitation to conferences and presentations of the project
- Top-1000. Priority in sales of diagnostics equipment

RoadMap

Stage 1 (December 2021)

- Issue a token on the Binance Smart Chain
- Create Whitepaper
- Create Telegram channel, telegram chat, Twitter account
- Launch a website <http://givetime.io/>
- Form a team
- Launch marketing campaigns
- Search for partners and influencers

Stage 2 (December 2021 - July 2022)

- Listing on Pancakeswap
- YouTube channel launch
- Promote the project
- Legal registration of a non-profit organization
- Form a medical scientific council
- Connect with startups and researchers
- Launch a website with a project's knowledge base
- Partnership with funds
- Launch on crypto exchanges tier 2-3

Stage 3 (July 2022 - October 2023)

- Launch on tier 2 crypto exchanges
- Construct a research center and clinic
- Form the teams in the strategic directions of the project
- Purchase of related startups, patents, research aimed at achieving the project goals
- Create MVPs in each area
- R&D Media Coverage
- Launch a clinic for the patient treatment

Stage 4 (November 2023 - September 2026)

- Open a clinic with modern methods of treatment and diagnostics - Top-30 in Europe
- Enter the market of diagnostics products
- Implement the methods of patient treatment according to scientific research of the center

Detailing stage 2 of the roadmap

(December 2021 - July 2022)

- **Listing on Pancake**

The token is released to the market and will be available for purchase and sale around the clock. The token will have market formation based on the supply and demand of the token. This is the first entry into the market, it will give the project an opportunity to be fully quoted on Coinmarketcap and then on Coingecko, which will give more confidence from new project participants.

- **Update white paper**

Important update to white paper. Which will give even more useful information to everyone who wants to learn about the project, the main and intermediate goals. As well as announcing the constant updating of the Whitepaper on a quarterly basis. So that the document is always as relevant and up-to-date as possible.

- **Legal registration of the company and registration of the trade mark**

The process of legal registration of the company on the basis of which all the offline tasks of the project will be implemented. It also allows you to give more confidence to the project, make the format for reporting expenditures of funds transparent and show in-project transactions with money and tokens. The trademark and its registration will give the opportunity to protect both the brand and the information around the project on legal grounds, which will also protect users from fraudsters and phishing resources.

Separately, there is the question of the country where the legal entity will be directly registered, so far there are a number of proposals, but for a final decision, all the future pros and cons of each jurisdiction should be considered within the framework of tax and economic opportunities for development. As well as the mandatory ability to officially manage the crypto assets of the project, without creating problems from the regulatory authorities. The legislation within the framework of medicine will also be taken into account, which will directly affect the creation and operation of both the research center, since the work of the first clinic and the use of our developments and treatment methods there.

The final decision on the choice of the region and country for registration will be determined only taking into account all these important parameters.

- **Formation of a medical scientific council**

For reasoned management and data analysis with regard to solving the project's tasks, namely the first directions: development of an alternative solution for enriching the human body with oxygen and a complex of diagnostic equipment for the cardiovascular system. It will require professionals with extensive experience in this area of medicine. It will involve both scientists who conduct research and development and doctors who have experience in diagnosing and treating people. In the future, medical engineers and medical lawyers will be involved, who will participate in the analysis of existing developments and patents and their subsequent purchase, as well as in the development of their own diagnostic and medical equipment from scratch.

- **Website update**

Finalization of the site as part of the expansion of the structure, placement of all important materials regarding the project on the site itself. Creation of a number of categories and headings that are important for the full coverage of all ongoing project events.

So far, it is planned to implement the site in 2 languages. English and Russian. Further, if necessary, we will add other languages in close cooperation with the marketing of the project and entering new markets. It is planned to prepare a structure for the information hub of the project, which will be on a separate domain, but will also be integrated with the main site.

- **Creation of Youtube channel**

First creation of a presentation in video format. Which will allow you to quickly familiarize yourself with the project in a convenient form and find out its main goals and advantages over other crypto projects.

Creation of a content plan for filming and publication of materials about the project, the systematic development of the channel. Adding interview format, video reports on project work and marketing activities.

- **AMA session on a project with the community**

An important stage in the development of the project is close communication with our audience. Answers to important questions, evaluation of proposals for the project. All this will give a strong connection and understanding of the importance of a common goal. It will build for many investors not only a desire to profit from investments, but also to participate in an important event within the framework of the possibility of medicine and science in general for mankind.

- **Expansion of the core team**

The attention of each team member gives a great impetus to the development of the project. It gives him the energy he needs to break through the information noise to many people. Based on the financial capabilities of the project and its stage of development, the team will constantly improve and expand.

In the first half of 2022, we see the composition of the team in such a listing

- Managers (6 people)
- PR manager (3 people)
- Marketers (3 people)
- Programmers (2 people)
- Scientists in biology and medicine (3 persons)
- Doctors and professors (4 people)
- Journalists (4 people)

Thus, a full team will include 20-30 people.

- **Listing to CEX (tier 2)**

Access to centralized crypto-exchanges. A long and important process for any crypto project. Increase your liquidity, confidence in the project, go through the verification stages and get some PR and support from the exchanges themselves.

At the moment, we are already considering all offers and choosing the most convenient and potentially successful formats for entering the exchanges. These will be 1-2 exchanges, with several trading pairs as available to our community as possible.

Presumably it will be

BNB - GTM

USDT - GTM

BTC - GTM

ETH - GTM
